Discstarter - professional CD-ROM menus

Discstarter is the industry-leading solution for HTML-based CD-ROM menus and offline content. Many [major companies](#) from around the world use Discstarter to successfully implement their start menus and front ends for software CD-ROM's, E-Learning publications, electronic catalogues, handbooks, digital business cards or company and product presentations. Discstarter is also used by [leading magazine publishers](#) to create professional covermount CD-ROM menus.

[New: The latest version Discstarter 4 is now available for you in the download area!](#)

Why use Discstarter?

Because Discstarter works and it is absolutely reliable!

Some of our clients use Discstarter for cover mount CD-ROMs and have distributed millions of copies over the years. None of them has ever had a problem with Discstarter - not on prehistoric Windows 95 machines nor on today's Windows Vista high-end computers.

Because Discstarter saves you money!

If you can create web pages you can also create CD-ROM menus and front ends with Discstarter - use the same technology, the same tools but get the professional look & feel on the offline media with Discstarter.

What is Discstarter?

Discstarter is a highly customizable offline browser that allows you to create professional looking CD-ROM menus and front ends out of favour and easy to create HTML pages that meet the highest demands on quality and reliability! No programming knowledge is required and time consuming familiarization with complex authoring tools is not necessary as well.

The menu front end is the first thing a user of your CD-ROM will see. And because the first impression is always critical, you should design your CD-ROM menus with great care. But it's easy with Discstarter!

The problem: Programming a classical CD-ROM menu using a programming language or an authoring system is very complex, time-consuming, error-prone and relatively expensive (you have to hire a programmer or do it yourself!).

The solution: Create your CD-ROM menus with HTML (Hyper Text Mark-up Language) in the same way as Web pages are built. All disadvantages of HTML-based CD-ROM menus (such as unprofessional look & feel in a normal browser window or errors that are related to security features of modern browsers such as popup blocker or blocking EXE files) can be swept away by Discstarter with only a few clicks!
